# 1. Introduction

In this section the overview and scope overview of the SRS will be discuss in detail. The purpose of the document is to provide complete detail of "NaMeNaYou", list of abbreviations, functions and features of the application. The main objective of this SRS documentation is to provide the detail analysis and gather the content in depth of the problem statement defined by the "NaMeNaYou". Moreover this document provides the high level system features to engage the stakeholders and other participants involved in the development of "NaMeNaYou" application. This SRS document provides the requirements of "NaMeNaYou" in detail to the developers to develop this application.

### 1.1 Purpose

The main purpose of this SRS document is analyse and collect all the information and requirements which defines the system properly to the admin, database manager and the end users (who use the system). All the ideas to develop the "NaMeNaYou" is combined to predict any sort of information which can be used to gain the better understanding of the application and concepts which can be developed later, all the ideas will be consider to develop the application.

The detailed overview of the application, its goals, parameters and objectives are provided in this SRS document. This document provides the application functional, non-functional requirements, hardware and software requirements to target the description of the application. It defines the flow of the application and the interaction of the user with the system in detail. However, it helps the designers and developers to support in the software development life cycle (SDLC) process.

The purpose of this "NaMeNaYou" application is to develop a mobile application in which users can order a taxi cab in the West Africa country of Nigeria and take safe journey to their destinations. Admin will control the flow of users and drivers on the application. The application will also provide the training session, a learning school for the users who want to learn how to be safe on the application.

### 1.2 Document Convention

The document conventions are as follows:

### Font style and Size

o Headings: Times New Roman (18).

o Sub-headings: Times New Roman (14).

o Text: Times New Roman (12).

o Line Spacing 2.0

### 1.3 Intended Audience and Reading Suggestions

This document is intended for the developers and designers which will develop the "NaMeNaYou" as per the requirements specified in the document. This document includes the scope of this system. That why we need this system? What is the purpose is to develop this product? In this document, we mention the features of this product, functional and non-functional requirements and the environment under which we have to work and also mention what we have learned during working on this project, different use cases, interfaces, our objectives which have to be achieved after the completion of this project, challenges we face in order to complete our product. Last but not least our completeness criteria.

Now, how we are able to complete this document developers gather all requirements in from of documentation and then they develop this product. The project manager will control the entire project including his all partners working on this product. Marketing staff advertise this product that how beneficial this product is and about the ease of product.

# 1.4 Project Scope

The system will be developed by the team of Engineers which have the knowledge of software development, networking, databases and graphic engineering. Each module of the system will be developed individually and merge in the end. The Quality assurance team will determine the functionality and feature of the systems and find out the bugs, errors and all other flaws that can be produced in future use of the system in any case. The system will be online for user which they can use on their personal computers, laptops and mobile phone devices.

# 1.5 Objective(s)/Aim(s)/Target(s)

Following are the objectives we want to achieve:

- Design a simple and interactive graphical interface of the system
- Design and implementation of all user portals
- Design and development of database system for overall system
- Design and development of driver module
- Design and development of customer module
- Design and implementation of admin module
- Implementation of support center
- Implementation of 24/7 help center

- Implementation of API's
- Performance Testing
- Quality testing

## 1.6 Nature of End Product

The end product will be mobile based system and it will require operating environment for a client and server GUI. The system will be operated with mobile phones.

### 1.7 References

- <a href="https://www.namenayoutaxi.com">https://www.namenayoutaxi.com</a>

# 2. Overall Description

In this portion, system perspective, system features, operating environment, design constraints, assumptions and dependencies will be explained in detail. This document contains the problem statement that the current system is facing which is hampering the growth opportunities of the company. It further contains a list of the stakeholders and users of the proposed solution. It also illustrates the needs and wants of the stakeholders that were identified in the brainstorming exercise as part of the requirements workshop. It further lists and briefly describes the major features and a brief description of each of the proposed system.

The following SRS contains the detail system perspective from different stakeholders and developers. It provides the detail product functions of "NaMeNaYou" with user characteristics permitted constraints, assumptions and dependencies and requirements subsets.

# 2.1 Product Perspective

This system is not dependent on any other outside system.

- High definition graphic display
- System API's

### 2.2 Product Functions

The "NaMeNaYou" platform is a mobile based application in which users can order a taxi cab in the West Africa country of Nigeria and take safe journey to their destinations. Admin will control the flow of users and drivers on the application. The application will also provide the training session, a learning school for the users who want to learn how to be safe on the application.

"NaMeNaYou" application contains following features as mentioned:

- Index screen
- Registration
- Login
- Dashboard of customer
- Dashboard of driver

### 2.2.1 Index screen

- The users will be able to view login button.
- The users will be able to view registration button.
- The users will be able to connect with the application through facebook.

### 2.2.2 Registration

- The users will be able to get register on the application.
- The users will be able to enter the first name, last name, email, password, confirm password, mobile number and type of user as driver or customer.
- The users will be able to get register on the application though facebook and google.

### 2.2.3 **Login**

- The users will be able to get login on the application.
- The users will be able to login through email.
- The users will be able to through mobile.
- The users will be able to login by entering email and password.
- The users will be able to login by entering mobile number.
- An OTP will be send to the user by which he can get login.
- The users will be able to get login though facebook and google.

### 2.2.4 Dashboard of customer

- The users will be able to book a ride.
- The users will be able to check booking status.
- The users will be able to calculate fair of the ride.
- The users will be able to view driver history.
- The users will be able to change password.
- The users will be able to give feedback to the driver.

### 2.2.5 Dashboard of driver

- The driver will be able to view all ride requests.
- The driver will be able to set availability.
- The driver will be able to check online booking.
- The driver will be able to view feedbacks.
- The driver will be able to ride history.

### 2.2.6 Dashboard of admin

- The admin will be able to get login on the application.
- The admin will be able to view all registered drivers.
- The admin will be able to view all registered users.
- The admin will be able to view requests / queries of users and drivers.
- The admin will be able to handle the calls of users and drivers.
- The admin will be able to search the drivers.
- The admin will be able to assign driver to a customer.

### 2.3 Product Features

### 2.3.1 Developer Portal

- On-boarding: Activities on-boarding new user to the user guide of system usage
- **Instructions Management:** Manages the activities of customers and drivers
- **Device Management:** Communicate and manages the internet
- Documentation: Provides users all necessary documentations for on-boarding, tutorials, how-TOS works and all the guidelines
- **Debugging:** Interface to display all logs generated by "NaMeNaYou"
- Analytics: Interface to display key statistics from system user devices and backend services
- User's Details: Interface to display the user's details including their activities
- **Verification:** User will have to be verified before using the system
- User confirmation: A confirmation mail will be send to the user's email when he/she will be logged in the system

### 2.3.2 Application Development

- The "NaMeNaYou" has to be developed in Flutter and it will be usable for both android and iOS
  - o The "NaMeNaYou" has to be developed in Java for android.
  - o The "NaMeNaYou" has to be developed in Swift for iOS.

### 2.3.3 Hardware Host Device

Hardware requirements for insurance on internet will be same for both parties which are as follows:

**Processor:** Dual Core

**RAM:** 2 GB

Hard Disk: 320 GB

**NIC:** For each party

# 2.4 Operating Environment

The system is mobile based and hence will require operating environment for a client and server GUI.

### 2.5 User Classes and Characteristics

The design of the interface must be minimal (number of clicks for completion of task should be minimum) and user-friendly for anyone to understand. The documentations/walk through must be easy enough for any user to understand and follow.

# 2.6 Design and Implementation Constraints

The "NaMeNaYou" is constrained by the interface to the device of the user. Since there are multiple system and multiple devices manufacturers, the interface will most likely not be the same for every one of them and the system design UI/UX should adapt and adjust on all type of devices. Also, there may be a difference between what features they facilitate each of them provide.

The Internet connection is also a constraint for the system. Since the application fetches data from the database over the internet to get the user's details, it is crucial that there is an internet connection for the application to function.

### 2.7 Privacy

The privacy of users will not hurt in the system as the database server will only keep the personal details. The system will save record of all the user's details and it will not be accessed to any other third party.

# 2.8 Hardware Specifications

Host devices running the system on client devices must run the internet connection.

### 2.9 False Positives

When there is no internet connection is available for the system then the system may not work properly according to the expectation. So, the internet connection must be required for this system to use it properly.

### 2.10 User Documentations and conditions

### 2.10.1 Security

User authentication and authorization is required. Users can only change their own schedules. Personal information must not be revealed due to privacy regulations like HIPAA.

### 2.10.2 Assumptions and Dependencies

The "NaMeNaYou" needs the internet connection, audio and video devices. Since the application must run over the internet, all the hardware shall require to connect internet will be hardware interface for the system as for e.g. Modem, WAN-LAN, Ethernet Cross-Cable.

# 3. External Interface Requirements

### 3.1 User Interface

The system interface must be user friendly and conform to consistent and standardized colours and fonts. Help links must be provided. Online documentation must be available and accessible on all pages. The system must meet accessibility standards. Several user interfaces must be available for all users.

### 3.2 Hardware Interfaces

Since the application must run over the internet, all the hardware shall require to connect internet will be hardware interface for the system as for e.g. Modem, WAN-LAN, Ethernet Cross-Cable.

### 3.3 Software interfaces:

- The system shall be online, all accounts must exist, and users must log in with.
- Authentication and authorization procedures must be used for the users.
- The system shall communicate with the Configuration to identify all the available components to configure the system.
- The system shall communicate with CRM system to provide support.
- The system shall communicate with internal database system for record management.
- The system shall communicate with social networking module.
- The system shall be verifying the authentication which shall allow the users to use the system.

## 3.4 Communication Interface

The "NaMeNaYou" shall use the HTTPS protocol for communication over the internet and for the intranet communication will be through TCP/IP protocol suite. The system will access files from its own memory. It will also interface with a database or external files from the internet to get the data. The communication between the different parts of the system is important since they depend on each other. However, in what way the communication is achieved is not important for the system and is therefore handled by the underlying operating systems for all component of the system.

# 4. Product Features / Functional Requirements

In this section, we will describe the overall functionality, use cases which can occur in our case, and also how user interacts with our software.

# 4.1 Functionality

This subsection contains the requirements for the "NaMeNaYou". These requirements are organized by the features discussed in the vision document. Features from vision documents are then refined into use case diagrams to best capture the functional requirements of the system. All these functional requirements can be traced using tractability matrix.

### 4.1.1 Interactive and Responsive GUI

- Simple and interactive graphical user interface.
- Task completion with minimal clicks.
- Creation of icons and widgets which are displayed to the users and organize them inside a screen window.
- Define functions that will process user and application events.
- Association of specific user events with specific functions.
- Start an infinite event-loop that processes user events. When a user event happens, the event-loop calls the function associated with that event.

### 4.1.2 Design and implementation of customer functionalities

- The users will be able to view login button.
- The users will be able to view registration button.
- The users and drivers will be able to get register though facebook and google.

- The users will be able to connect with the application through facebook.
- The users will be able to get register on the application.
- The users will be able to enter the first name, last name, email, password, confirm password, mobile number and type of user as driver or customer.
- The users will be able to get login on the application.
- The users will be able to login through email.
- The users will be able to through mobile.
- The users will be able to login by entering email and password.
- The users will be able to login by entering mobile number.
- An OTP will be send to the user by which he can get login.
- The users will be able to book a ride.
- The users will be able to check booking status.
- The users will be able to calculate fair of the ride.
- The users will be able to view driver history.
- The users will be able to change password.
- The users will be able to give feedback to the driver.

### 4.1.3 Design and implementation of driver functionalities

- The users will be able to view login button.
- The users will be able to view registration button.
- The users will be able to connect with the application through facebook.
- The users will be able to get register on the application.

- The users will be able to enter the first name, last name, email, password, confirm password, mobile number and type of user as driver or customer.
- The users will be able to get login on the application.
- The users will be able to login through email.
- The users will be able to through mobile.
- The users will be able to login by entering email and password.
- The users will be able to login by entering mobile number.
- An OTP will be send to the user by which he can get login.
- The driver will be able to view all ride requests.
- The driver will be able to set availability.
- The driver will be able to check online booking.
- The driver will be able to view feedbacks.
- The driver will be able to ride history.

### 4.1.4 Store the data in database

• The system will have a database in which all the records of users and their activities will be saved automatically with time to time.

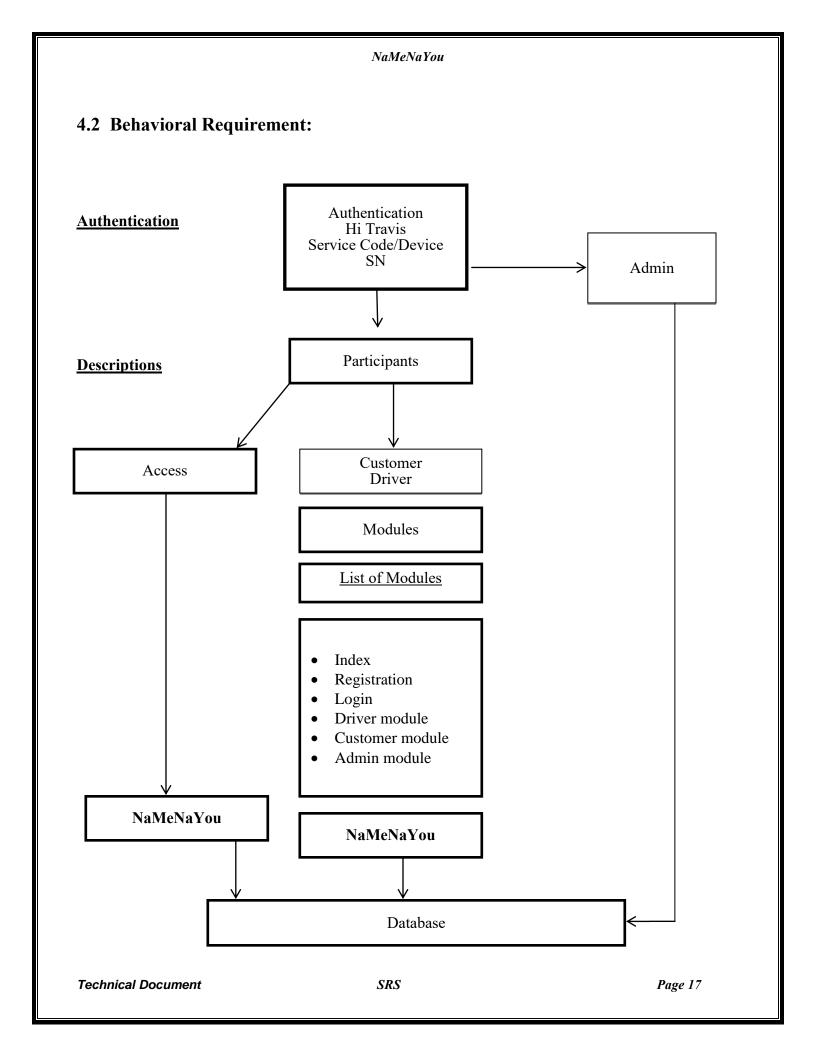

### 4.1.5 Maintain user profile

- The system shall allow user to create profile and set his credential.
- The system shall authenticate user credentials to view the profile.
- The system shall allow user to update the profile information.

| Na    | Mol   | Va <sup>*</sup> | You |
|-------|-------|-----------------|-----|
| 1 Y U | 11161 | YU.             | LVU |

| 4 4 |   | T     | • 1   | C+    | 4 •   |
|-----|---|-------|-------|-------|-------|
| 4 1 | h | H.mai | II CA | ntirm | ation |

- The system shall maintain user email information as a required part of user profile.
- The system shall send user confirmation to the user through email.

# 4.3 Use Cases Diagrams

## 4.3.1 Use case diagram of Customer

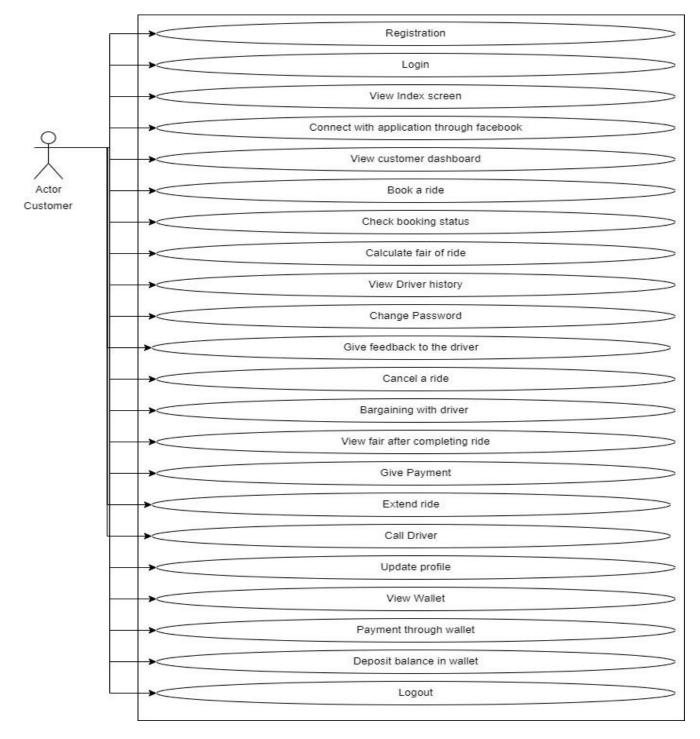

Figure: Use Case diagram of customer

# 4.3.2 Use case diagram of driver

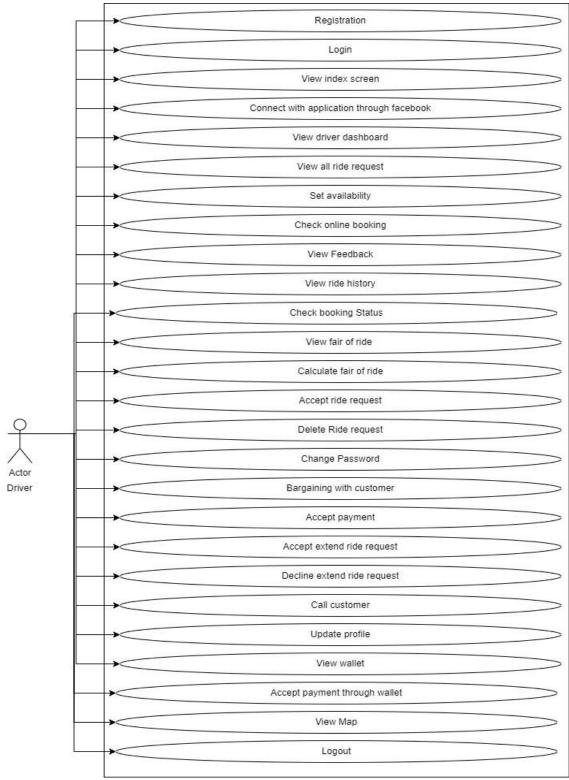

Figure: Use Case diagram of driver

# 4.3.3 Use case diagram of admin

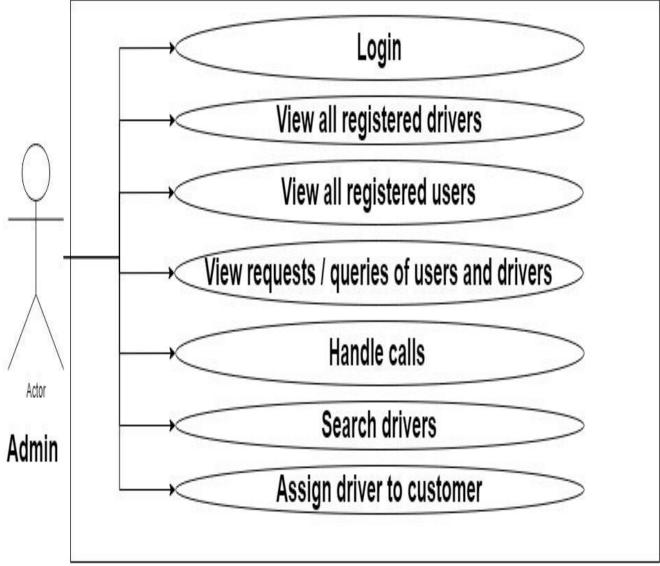

Figure: Use Case diagram of admin

# **4.3.4** Use Cases Description

| <b>Use-Case Name:</b>             | Registration   |  |
|-----------------------------------|--|--|
| Use-Case ID:                      | Usecase-001  | Use Case Type  |
| Priority:                         | High   | Business Requirements □  |
| Source:                           | Functional Requirement Document  | 1  |

| Conclusion:                    | Admin will assign driver to customer.  |  |
| <b>Business Rules:</b>         | The data will be stored in the database.   |  |
| Open Issues:                   | Need to determine how to perform this functionality.                                     |  |

# 5. Technical Requirements

# 5.1 Usability

# **5.1.1** Graphical User Interface

- The system shall provide a uniform look and feel between all the web pages.
- The system shall provide digital details for each profile.
- The system shall provide use of icons and toolbars.

### 5.1.2 Accessibility

• The system shall provide multi language support.

# 5.2 Reliability and Availability

#### **5.2.1 Back-end Internal Computers**

- The system shall provide storage of all databases on redundant computers with automatic switchover.
- The system shall provide for replication of databases to off-site storage locations.
- The system shall provide RAID V Disk Stripping on all database storage disks.

#### **5.2.2** Internet Service Provider

- The system shall provide a contractual agreement with an internet service provider for T3 access with 99.9999% availability.
- The system shall provide a contractual agreement with an internet service provider who can provide 99.999% availability through their network facilities onto the internet.

# 5.3 Security

#### 5.3.1 Data Transfer

- The system shall use secure sockets in all transactions that include any confidential user's information.
- The system shall automatically log out all users after a period of inactivity.
- The system shall not leave any cookies on the user's computer containing the user's password.
- The system shall not leave any cookies on the user's computer containing any of the user's confidential information.

# 5.3.2 Data Storage

- The user's web browser shall never display a user's password. It shall always be echoed with special characters representing typed characters.
- The system's back-end servers shall never display a user's password. The user's password may be reset but never shown.
- The system's back-end servers shall only be accessible to authenticated administrators.
- The system's back-end database shall be encrypted.

# 5.4 Supportability

#### **5.4.1 Configuration Management Tool**

• The source code developed for this system shall be maintained in configuration management tool.

.

# **5.5 Design Constraints**

#### **5.5.1 Standard Development Tools**

• The system shall be built using a standard web page development tool that conforms to either IBM's CUA standards or Microsoft's GUI standards.

# 5.5.2 Web Based facility

- There are no memory requirements
- The computers must be equipped with web browsers such as internet explorer.
- The data must be stored in such a way that allows the client easy access to it.
- Response time of the system should take no longer than one minute.
- A general knowledge of basic computer skills is required to use the system.

# 5.6 On-line User Documentation and Help System Requirements

- As the product is online so on-line help system becomes a critical component of the system which shall provide.
- It shall provide specific guidelines to a user for using the system.
- To implement online user help, link and search fields shall be provided.

# **5.7 Purchased Components**

Not Applicable

# 5.8 Interfaces

- The protocol used shall be HTTP.
- The Port number used will be 80.

# 6. Other Non-functional Requirements

# 6.1 System access

Preconditions include that the system must be online, all accounts must exist, and users must log in with. Authentication and authorization procedures must be used.

# **6.2** Performance Requirements

The system must be able to service multiple terminal connections simultaneously with at least 75 internet users connected without delay.

The system must be able to process 90% of queries within a fraction of a second.

# **6.3** Security Requirements

User authentication and authorization is required. Users can only change their own schedules. Personal information must not be revealed due to privacy regulations like HIPAA.

#### 6.4 Hardware/Software

It is anticipated that no special hardware would be required; however, a database management system will be required.

it is anticipated that any web browser could be used and any computer with Internet access could be used by all types of people who will access the system. Servers will be required to store the scheduling data and backups. It seems that no major site adaptations are required.

The system must be online and accessible for Windows, Linux/Unit, or Macintosh systems with a GUI interface through browsers. It must be interoperable with other systems that users are like to need like Adobe Acrobat.

# 6.5 Database

Database requirements include information collected for customers and drivers. One day for example might consist of many different time slots perhaps spaced 15 minutes apart.

The database should be normalized for space usage efficiency and response time of less than three seconds.

The database must handle a maximum of 2500 users. Any invalid data must be recovered with messages back to the user. 7 days a week for 24 hours each day. A backup plan must be implements with disaster recovery included.

# **6.6** User Interface

The system interface must be user friendly and conform to consistent and standardized colours and fonts. Help links must be provided. Online documentation must be available and accessible on all pages. The system must meet accessibility standards. Several user interfaces must be available for all users.

# **Appendix A: Glossary**

| Term | Definition  |
|------|---|
| SaaS | Software as a Service                                     |
| User | who uses the system                                       |
| 24/7 | Twenty-four hours a day, seven days a week, all the time. |
| CRM  | User Relationship Management                              |
| SDLC | Software Development Lifecycle                            |
| GUI  | Graphical User Interface                                  |
